

ABSTRACT

"Authorisation of Online Transactions"

- 5 An authorisation system (2) is hosted by a financial institution to allow it to authorise transactions for customers having multiple users. Users of the customer can access an authorisation control model (4) to define transaction types according to conditions (11) and to define an authority state (10) associated with each transaction type. Each authority state (10) defines approval signatory
- 10 sets and groups with Boolean AND and OR relationships to satisfy approval requirements.
